# Mixer cleaning with recycled water

Reduce fresh water use by up to 80%

**NEW**

**WALTER** 

# More with less!

## New automated cleaning process with reduced water consumption

Generate less grey water and reduce fresh water requirements with automatic mixer cleaning.

After all, a typical problem in the concrete industry is: the dirty water produced by the cleaning process is becoming increasingly difficult and cost-intensive to dispose of. Reduce water treatment and disposal costs.

- / fresh water savings of up to 80%
- / less grey water
- / for new and existing systems

### How it works

An intelligent control system decides in which processes recycled water can be used and subsequently flushes all lines with fresh water.

The use of recycled and fresh water is automated and can be switched to manual operation if so desired. The availability of recycled and fresh water is constantly checked to prevent the pump from running dry.
